

Chapter 2

Introduction to

Java Applications;

Input/Output and Operators

Java™ How to Program, 10/e

OBJECTIVES

In this chapter you'll:

- Write simple Java applications.
- Use input and output statements.
- Learn about Java's primitive types.
- Understand basic memory concepts.
- Use arithmetic operators.
- Learn the precedence of arithmetic operators.
- Write decision-making statements.
- Use relational and equality operators.

2.1 Introduction

2.2 Your First Program in Java: Printing a Line of Text

2.3 Modifying Your First Java Program

2.4 Displaying Text with `printf`

2.5 Another Application: Adding Integers

2.5.1 `import` Declarations

2.5.2 Declaring Class `Addition`

2.5.3 Declaring and Creating a `Scanner` to Obtain User Input from the Keyboard

2.5.4 Declaring Variables to Store Integers

2.5.5 Prompting the User for Input

2.5.6 Obtaining an `int` as Input from the User

2.5.7 Prompting for and Inputting a Second `int`

2.5.8 Using Variables in a Calculation

2.5.9 Displaying the Result of the Calculation

2.5.10 Java API Documentation

2.6 Memory Concepts

2.7 Arithmetic

2.8 Decision Making: Equality and Relational Operators

2.9 Wrap-Up

2.1 Introduction

- ▶ Java application programming
- ▶ Use tools from the JDK to compile and run programs.
- ▶ Videos at www.deitel.com/books/jhtp10/
 - Help you get started with Eclipse, NetBeans and IntelliJ IDEA integrated development environments.

2.2 Your First Program in Java: Printing a Line of Text

- ▶ Java application
 - A computer program that executes when you use the `java command` to launch the Java Virtual Machine (JVM).
- ▶ Sample program in Fig. 2.1 displays a line of text.

```
1 // Fig. 2.1: Welcome1.java
2 // Text-printing program.
3
4 public class Welcome1
5 {
6     // main method begins execution of Java application
7     public static void main(String[] args)
8     {
9         System.out.println("Welcome to Java Programming!");
10    } // end method main
11 } // end class Welcome1
```

Welcome to Java Programming!

Fig. 2.1 | Text-printing program.

2.2 Your First Program in Java: Printing a Line of Text (Cont.)

Commenting Your Programs

► Comments

// Fig. 2.1: Welcome1.java

- // indicates that the line is a **comment**.
- Used to **document programs** and improve their readability.
- Compiler ignores comments.
- A comment that begins with // is an **end-of-line comment**—it terminates at the end of the line on which it appears.

► Traditional comment, can be spread over several lines as in

/* This is a traditional comment. It
can be split over multiple lines */

- This type of comment begins with /* and ends with */.
- All text between the delimiters is ignored by the compiler.

2.2 Our First Program in Java: Printing a Line of Text (Cont.)

► Javadoc comments

- Delimited by `/**` and `*/`.
- All text between the Javadoc comment delimiters is ignored by the compiler.
- Enable you to embed program documentation directly in your programs.
- The [javadoc utility program](#) (online Appendix G) reads Javadoc comments and uses them to prepare program documentation in HTML format.

Common Programming Error 2.1

*Forgetting one of the delimiters of a traditional or Java-doc comment is a syntax error. A **syntax error** occurs when the compiler encounters code that violates Java's language rules (i.e., its syntax). These rules are similar to a natural language's grammar rules specifying sentence structure. Syntax errors are also called **compiler errors**, **compile-time errors** or **compilation errors**, because the compiler detects them when compiling the program. When a syntax error is encountered, the compiler issues an error message. You must eliminate all compilation errors before your program will compile properly.*

Good Programming Practice 2.1

Some organizations require that every program begin with a comment that states the purpose of the program and the author, date and time when the program was last modified.

Error-Prevention Tip 2.1

As you write new programs or modify existing ones, keep your comments up-to-date with the code. Programmers will often need to make changes to existing code to fix errors or to enhance capabilities. Updating your comments helps ensure that they accurately reflect what the code does. This will make your programs easier to understand and modify in the future. Programmers using or updating code with out-of-date comments might make incorrect assumptions about the code that could lead to errors or even security breaches.

2.2 Your First Program in Java: Printing a Line of Text (Cont.)

Using Blank Lines

- ▶ Blank lines, space characters and tabs
 - Make programs easier to read.
 - Together, they're known as **white space** (or whitespace).
 - White space is ignored by the compiler.

Good Programming Practice 2.2

Use blank lines and spaces to enhance program readability.

2.2 Your First Program in Java: Printing a Line of Text (Cont.)

Declaring a class

► Class declaration

```
public class Welcome1
```

- Every Java program consists of at least one class that you define.
- **class keyword** introduces a class declaration and is immediately followed by the **class name**.
- **Keywords** (Appendix C) are reserved for use by Java and are always spelled with all lowercase letters.

2.2 Your First Program in Java: Printing a Line of Text (Cont.)

Filename for a public Class

- ▶ A public class must be placed in a file that has a filename of the form *ClassName.java*, so class Welcome1 is stored in the file Welcome1.java.

Common Programming Error 2.2

A compilation error occurs if a public class's filename is not exactly same name as the class (in terms of both spelling and capitalization) followed by the .java extension.

2.2 Your First Program in Java: Printing a Line of Text (Cont.)

Class Names and Identifiers

- ▶ By convention, begin with a capital letter and capitalize the first letter of each word they include (e.g., SampleClassName).
- ▶ A class name is an **identifier**—a series of characters consisting of letters, digits, underscores (_) and dollar signs (\$) that does not begin with a digit and does not contain spaces.
- ▶ Java is **case sensitive**—uppercase and lowercase letters are distinct—so a1 and A1 are different (but both valid) identifiers.

2.2 Your First Program in Java: Printing a Line of Text (Cont.)

Class Body

- ▶ A **left brace**, {, begins the **body** of every class declaration.
- ▶ A corresponding **right brace**, }, must end each class declaration.

Good Programming Practice 2.3

Indent the entire body of each class declaration one “level” between the left brace and the right brace that delimit the body of the class. This format emphasizes the class declaration’s structure and makes it easier to read. We use three spaces to form a level of indent—many programmers prefer two or four spaces. Whatever you choose, use it consistently.

Error-Prevention Tip 2.2

When you type an opening left brace, {, immediately type the closing right brace, }, then reposition the cursor between the braces and indent to begin typing the body. This practice helps prevent errors due to missing braces. Many IDEs insert the closing right brace for you when you type the opening left brace.

Common Programming Error 2.3

It's a syntax error if braces do not occur in matching pairs.

Good Programming Practice 2.4

IDEs typically indent code for you. The Tab key may also be used to indent code. You can configure each IDE to specify the number of spaces inserted when you press Tab.

2.2 Your First Program in Java: Printing a Line of Text (Cont.)

Declaring a Method

```
public static void main( String[] args )
```

- ▶ Starting point of every Java application.
- ▶ **Parentheses** after the identifier `main` indicate that it's a program building block called a **method**.
- ▶ Java class declarations normally contain one or more methods.
- ▶ `main` must be defined as shown; otherwise, the JVM will not execute the application.
- ▶ Methods perform tasks and can return information when they complete their tasks.
- ▶ Keyword **void** indicates that this method will not return any information.

Good Programming Practice 2.5

Indent the entire body of each method declaration one “level” between the braces that define the body of the method. This makes the structure of the method stand out and makes the method declaration easier to read.

2.2 Your First Program in Java: Printing a Line of Text (Cont.)

- ▶ **Body of the method declaration**

- Enclosed in left and right braces.

- ▶ **Statement**

`System.out.println("Welcome to Java Programming!");`

- Instructs the computer to perform an action
 - Display the characters contained between the double quotation marks.
 - Together, the quotation marks and the characters between them are a **string**—also known as a **character string** or a **string literal**.
 - White-space characters in strings are *not* ignored by the compiler.
 - Strings *cannot* span multiple lines of code.

Error-Prevention Tip 2.3

When the compiler reports a syntax error, it may not be on the line that the error message indicates. First, check the line for which the error was reported. If you don't find an error on that line, check several preceding lines.

2.2 Your First Program in Java: Printing a Line of Text (Cont.)

- ▶ `System.out` object
 - Standard output object.
 - Allows a Java application to display information in the command window from which it executes.
- ▶ `System.out.println` method
 - Displays (or prints) a line of text in the command window.
 - The string in the parentheses is the argument to the method.
 - Positions the output cursor at the beginning of the next line in the command window.
- ▶ Most statements end with a semicolon.

2.2 Your First Program in Java: Printing a Line of Text (Cont.)

Compiling Your First Java Application

- ▶ Open a command window and change to the directory where the program is stored.
- ▶ Many operating systems use the command `cd` to change directories.
- ▶ To compile the program, type
`j avac Wel come1. j ava`
- ▶ If the program contains no compilation errors, preceding command creates a. `.cl ass` file (known as the **class file**) containing the platform-independent Java bytecodes that represent the application.
- ▶ When we use the `j ava` command to execute the application on a given platform, these bytecodes will be translated by the JVM into instructions that are understood by the underlying operating system.

Common Programming Error 2.4

When using javac, if you receive a message such as “bad command or filename,” “javac: command not found” or “'javac' is not recognized as an internal or external command, operable program or batch file,” then your Java software installation was not completed properly. This indicates that the system’s PATH environment variable was not set properly. Carefully review the installation instructions in the Before You Begin section of this book. On some systems, after correcting the PATH, you may need to reboot your computer or open a new command window for these settings to take effect.

Common Programming Error 2.5

The compiler error message “class Welcome1 is public, should be declared in a file named Welcome1.java” indicates that the filename does not match the name of the public class in the file or that you typed the class name incorrectly when compiling the class.

2.2 Your First Program in Java: Printing a Line of Text (Cont.)

Executing the Welcome1 Application

- ▶ To execute this program in a command window, change to the directory containing `Welcome1.java`—`C:\examples\ch02\fig02_01` on Microsoft Windows or `~/Documents/examples/ch02/fig02_01` on Linux/OS X.
- ▶ Next, type `java Welcome1`.
- ▶ This launches the JVM, which loads the `Welcome1.class` file.
- ▶ The command *omits* the `.class` file-name extension; otherwise, the JVM will *not* execute the program.
- ▶ The JVM calls class `Welcome1`'s `main` method.

Error-Prevention Tip 2.4

*When attempting to run a Java program, if you receive a message such as "Exception in thread "main"
java.lang.NoClassDefFoundError:*

Welcome1," your CLASSPATH environment variable has not been set properly. Please carefully review the installation instructions in the Before You Begin section of this book. On some systems, you may need to reboot your computer or open a new command window after configuring the CLASSPATH.

```
C:\examples\ch02\f1g02_01>java Welcome1
Welcome to Java Programming!
C:\examples\ch02\f1g02_01>
```

You type this command to execute the application

The program outputs to the screen
Welcome to Java Programming!

Fig. 2.2 | Executing Welcome1 from the Command Prompt.

2.3 Modifying Your First Java Program

- ▶ Class `Welcome2`, shown in Fig. 2.3, uses two statements to produce the same output as that shown in Fig. 2.1.
- ▶ New and key features in each code listing are highlighted.
- ▶ `System.out`'s method `print` displays a string.
- ▶ Unlike `println`, `print` does not position the output cursor at the beginning of the next line in the command window.
 - The next character the program displays will appear immediately after the last character that `print` displays.

```
1 // Fig. 2.3: Welcome2.java
2 // Printing a line of text with multiple statements.
3
4 public class Welcome2
5 {
6     // main method begins execution of Java application
7     public static void main(String[] args)
8     {
9         System.out.print("Welcome to ");
10        System.out.println("Java Programming!");
11    } // end method main
12 } // end class Welcome2
```

Welcome to Java Programming!

Fig. 2.3 | Printing a line of text with multiple statements.

2.3 Modifying Your First Java Program (Cont.)

- ▶ Newline characters indicate to `System.out`'s `print` and `println` methods where to position the output cursor at the beginning of the next line in the command window.
- ▶ Newline characters are whitespace characters.
- ▶ The **backslash (\)** is called an **escape character**.
 - Indicates a “special character”
- ▶ Backslash is combined with the next character to form an **escape sequence**—`\n` represents the newline character.
- ▶ Complete list of escape sequences

<http://docs.oracle.com/javase/specs/jls/se7/html/jls-3.html#jls-3.10.6>.

```
1 // Fig. 2.4: Welcome3.java
2 // Printing multiple lines of text with a single statement.
3
4 public class Welcome3
5 {
6     // main method begins execution of Java application
7     public static void main(String[] args)
8     {
9         System.out.println("Welcome\nto\nJava\nProgramming!");
10    } // end method main
11 } // end class Welcome3
```

```
Welcome
to
Java
Programming!
```

Fig. 2.4 | Printing multiple lines of text with a single statement.

Escape sequence	Description
\n	Newline. Position the screen cursor at the beginning of the <i>next</i> line.
\t	Horizontal tab. Move the screen cursor to the next tab stop.
\r	Carriage return. Position the screen cursor at the beginning of the <i>current</i> line—do <i>not</i> advance to the next line. Any characters output after the carriage return <i>overwrite</i> the characters previously output on that line.
\\"	Backslash. Used to print a backslash character.
\"	Double quote. Used to print a double-quote character. For example, <code>System.out.println("\\"in quotes\"");</code> displays "in quotes".

Fig. 2.5 | Some common escape sequences.

2.4 Displaying Text with printf

- ▶ `System.out.printf` method
 - `f` means “formatted”
 - displays *formatted* data
- ▶ Multiple method arguments are placed in a **comma-separated list**.
- ▶ Calling a method is also referred to as **invoking** a method.
- ▶ Java allows large statements to be split over many lines.
 - Cannot split a statement in the middle of an identifier or string.
- ▶ Method `printf`’s first argument is a **format string**
 - May consist of **fixed text** and **format specifiers**.
 - Fixed text is output as it would be by `print` or `println`.
 - Each format specifier is a placeholder for a value and specifies the type of data to output.
- ▶ Format specifiers begin with a percent sign (%) and are followed by a character that represents the data type.
- ▶ Format specifier `%s` is a placeholder for a string.

```
1 // Fig. 2.6: Welcome4.java
2 // Displaying multiple lines with method System.out.printf.
3
4 public class Welcome4
5 {
6     // main method begins execution of Java application
7     public static void main(String[] args)
8     {
9         System.out.printf("%s%n%s%n",
10             "Welcome to", "Java Programming!");
11     } // end method main
12 } // end class Welcome4
```

```
Welcome to
Java Programming!
```

Fig. 2.6 | Displaying multiple lines with method `System.out.printf`.

Good Programming Practice 2.6

*Place a space after each comma (,) in an argument list
to make programs more readable.*

Common Programming Error 2.6

Splitting a statement in the middle of an identifier or a string is a syntax error.

2.5 Another Application: Adding Integers

- ▶ **Integers**

- Whole numbers, like -22 , 7 , 0 and 1024)
- ▶ Programs remember numbers and other data in the computer's memory and access that data through program elements called **variables**.
- ▶ The program of Fig. 2.7 demonstrates these concepts.

```
1 // Fig. 2.7: Addition.java
2 // Addition program that inputs two numbers then displays their sum.
3 import java.util.Scanner; // program uses class Scanner
4
5 public class Addition
6 {
7     // main method begins execution of Java application
8     public static void main(String[] args)
9     {
10         // create a Scanner to obtain input from the command window
11         Scanner input = new Scanner(System.in);
12
13         int number1; // first number to add
14         int number2; // second number to add
15         int sum; // sum of number1 and number2
16
17         System.out.print("Enter first integer: "); // prompt
18         number1 = input.nextInt(); // read first number from user
19
20         System.out.print("Enter second integer: "); // prompt
21         number2 = input.nextInt(); // read second number from user
22 }
```

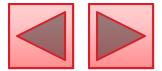

Fig. 2.7 | Addition program that inputs two numbers then displays their sum. (Part 1 of 2.)

```
23     sum = number1 + number2; // add numbers, then store total in sum
24
25     System.out.printf("Sum is %d\n", sum); // display sum
26 } // end method main
27 } // end class Addition
```

```
Enter first integer: 45
Enter second integer: 72
Sum is 117
```

Fig. 2.7 | Addition program that inputs two numbers then displays their sum. (Part 2 of 2.)

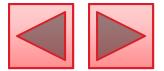

2.5.1 import Declarations

- ▶ Helps the compiler locate a class that is used in this program.
- ▶ Rich set of predefined classes that you can reuse rather than “reinventing the wheel.”
- ▶ Classes are grouped into *packages*—*named groups of related classes*—and are collectively referred to as the [Java class library](#), or the [Java Application Programming Interface \(Java API\)](#).
- ▶ You use `import` declarations to identify the predefined classes used in a Java program.

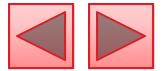

Common Programming Error 2.7

All import declarations must appear before the first class declaration in the file. Placing an import declaration inside or after a class declaration is a syntax error.

Common Programming Error 2.8

Forgetting to include an import declaration for a class that must be imported results in a compilation error containing a message such as “cannot find symbol.” When this occurs, check that you provided the proper import declarations and that the names in them are correct, including proper capitalization.

Software Engineering Observation 2.1

*In each new Java version, the APIs typically contain new capabilities that fix bugs, improve performance or offer better means for accomplishing tasks. The corresponding older versions are no longer needed and should not be used. Such APIs are said to be **deprecated** and might be removed from later Java versions.*

You'll often encounter deprecated APIs when browsing the online API documentation. The compiler will warn you when you compile code that uses deprecated APIs. If you compile your code with `javac` using the command-line argument – `deprecation`, the compiler will tell you which deprecated features you're using. For each one, the online documentation (<http://docs.oracle.com/javase/7/docs/api/>) indicates and typically links to the new feature that replaces the deprecated one.

2.5.3 Declaring and Creating a Scanner to Obtain User Input from the Keyboard

▶ Variable declaration statement

```
Scanner input = new Scanner( System.in );
```

- Specifies the name (`input`) and type (`Scanner`) of a variable that is used in this program.

▶ Variable

- A location in the computer's memory where a value can be stored for use later in a program.
- *Must* be declared with a `name` and a `type` before they can be used.
- A variable's *name* enables the program to access the value of the variable in memory.
- The name can be any valid identifier.
- A variable's type specifies what kind of information is stored at that location in memory.

2.5 Another Application: Adding Integers (Cont.)

- ▶ **Scanner**
 - Enables a program to read data for use in a program.
 - Data can come from many sources, such as the user at the keyboard or a file on disk.
 - Before using a **Scanner**, you must create it and specify the source of the data.
- ▶ The equals sign (=) in a declaration indicates that the variable should be **initialized** (i.e., prepared for use in the program) with the result of the expression to the right of the equals sign.
- ▶ The **new** keyword creates an object.
- ▶ **Standard input object, System.in**, enables applications to read bytes of data typed by the user.
- ▶ **Scanner** object translates these bytes into types that can be used in a program.

2.5.4 Declaring Variables to Store Integers

- ▶ Variable declaration statements

```
int number1; // first number to add  
int number2; // second number to add  
int sum; // sum of number1 and number2
```

declare that variables `number1`, `number2` and `sum` hold data of type `int`

- They can hold integer.
- Range of values for an `int` is $-2,147,483,648$ to $+2,147,483,647$.
- The `int` values you use in a program may not contain commas.
- ▶ Several variables of the same type may be declared in one declaration with the variable names separated by commas.

Good Programming Practice 2.7

Declare each variable in its own declaration. This format allows a descriptive comment to be inserted next to each variable being declared.

Good Programming Practice 2.8

Choosing meaningful variable names helps a program to be self-documenting (i.e., one can understand the program simply by reading it rather than by reading associated documentation or creating and viewing an excessive number of comments).

Good Programming Practice 2.9

*By convention, variable-name identifiers begin with a lowercase letter, and every word in the name after the first word begins with a capital letter. For example, variable-name identifier `firstNumber` starts its second word, `Number`, with a capital N. This naming convention is known as **camel case**, because the uppercase letters stand out like a camel's humps.*

2.5.5 Prompting the User for Input

- ▶ **Prompt**

- Output statement that directs the user to take a specific action.

- ▶ **Class System**

- Part of package `java.lang`.
 - Class **System** is not imported with an `import` declaration at the beginning of the program.

Software Engineering Observation 2.2

By default, package `java.lang` is imported in every Java program; thus, classes in `java.lang` are the only ones in the Java API that do not require an import declaration.

2.5.6 Obtaining an int as Input from the User

- ▶ Scanner method `nextInt`

```
number1 = input.nextInt(); // read first number from user
```

- Obtains an integer from the user at the keyboard.
- Program *waits* for the user to type the number and press the *Enter* key to submit the number to the program.
- ▶ The result of the call to method `nextInt` is placed in variable `number1` by using the **assignment operator**, `=`.
 - “`number1` gets the value of `input.nextInt()`.”
 - Operator `=` is called a **binary operator**—it has *two operands*.
 - Everything to the *right* of the assignment operator, `=`, is always evaluated *before* the assignment is performed.

Good Programming Practice 2.10

Place spaces on either side of a binary operator for readability.

2.5 Another Application: Adding Integers (Cont.)

► Arithmetic

```
sum = number1 + number2; // add numbers then store total  
    in sum
```

- Assignment statement that calculates the sum of the variables `number1` and `number2` then assigns the result to variable `sum` by using the assignment operator, `=`.
- “`sum` gets the value of `number1 + number2`.”
- Portions of statements that contain calculations are called **expressions**.
- An expression is any portion of a statement that has a value associated with it.

2.5.9 Displaying the Result of the Calculation

- ▶ Integer formatted output

```
System.out.printf("Sum is %d%n", sum);
```

- Format specifier `%d` is a *placeholder* for an `int` value
- The letter `d` stands for “decimal integer.”

2.6 Memory Concepts

► Variables

- Every variable has a **name**, a **type**, a **size** (in bytes) and a **value**.
- When a new value is placed into a variable, the new value replaces the previous value (if any)
- The previous value is lost, so this process is said to be *destructive*.

number1

45

Fig. 2.8 | Memory location showing the name and value of variable `number1`.

Fig. 2.9 | Memory locations after storing values for **number1** and **number2**.

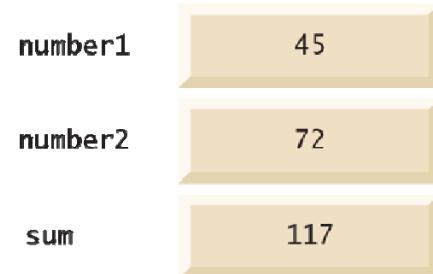

Fig. 2.10 | Memory locations after storing the sum of `number1` and `number2`.

2.7 Arithmetic

- ▶ Arithmetic operators are summarized in Fig. 2.11.
- ▶ The asterisk (*) indicates multiplication
- ▶ The percent sign (%) is the remainder operator
- ▶ The arithmetic operators are binary operators because they each operate on two operands.
- ▶ Integer division yields an integer quotient.
 - Any fractional part in integer division is simply *truncated* (i.e., *discarded*)—no *rounding* occurs.
- ▶ The remainder operator, %, yields the remainder after division.

Java operation	Operator	Algebraic expression	Java expression
Addition	+	$f + 7$	<code>f + 7</code>
Subtraction	-	$p - c$	<code>p - c</code>
Multiplication	*	$b m$	<code>b * m</code>
Division	/	x / y OR $\frac{x}{y}$ OR $x \div y$	<code>x / y</code>
Remainder	%	$r \bmod s$	<code>r % s</code>

Fig. 2.11 | Arithmetic operators.

2.7 Arithmetic (Cont.)

- ▶ Arithmetic expressions in Java must be written in **straight-line form** to facilitate entering programs into the computer.
- ▶ Expressions such as “a divided by b” must be written as a / b , so that all constants, variables and operators appear in a straight line.
- ▶ Parentheses are used to group terms in expressions in the same manner as in algebraic expressions.
- ▶ If an expression contains **nested parentheses**, the expression in the innermost set of parentheses is evaluated first.

2.7 Arithmetic (Cont.)

► Rules of operator precedence

- Multiplication, division and remainder operations are applied first.
- If an expression contains several such operations, they are applied from left to right.
- Multiplication, division and remainder operators have the same level of precedence.
- Addition and subtraction operations are applied next.
- If an expression contains several such operations, the operators are applied from left to right.
- Addition and subtraction operators have the same level of precedence.
- When we say that operators are applied from left to right, we are referring to their **associativity**.
- Some operators associate from right to left.
- Complete precedence chart is included in Appendix A.

Operator(s)	Operation(s)	Order of evaluation (precedence)
*	Multiplication	Evaluated first. If there are several operators of this type, they're evaluated from <i>left to right</i> .
/	Division	
%	Remainder	
+	Addition	Evaluated next. If there are several operators of this type, they're evaluated from <i>left to right</i> .
-	Subtraction	
=	Assignment	Evaluated last.

Fig. 2.12 | Precedence of arithmetic operators.

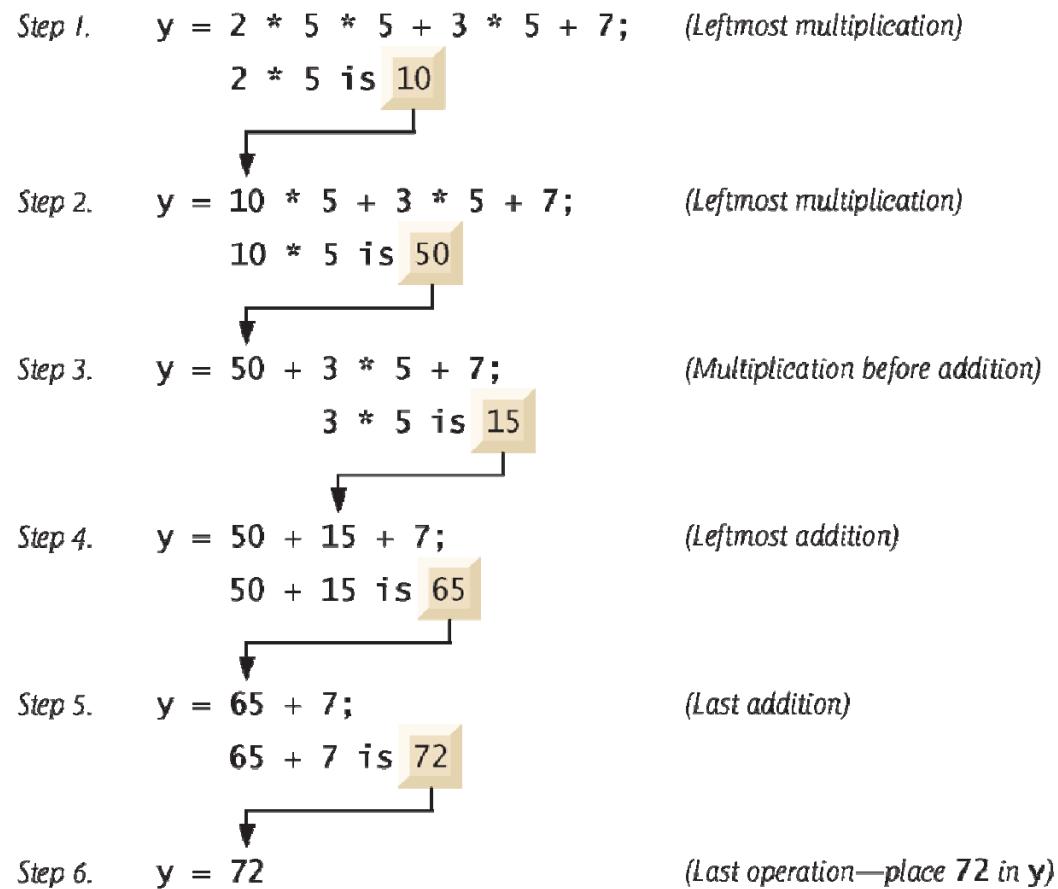

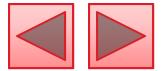

Fig. 2.13 | Order in which a second-degree polynomial is evaluated.

2.7 Arithmetic (Cont.)

- ▶ As in algebra, it's acceptable to place *redundant parentheses* (unnecessary parentheses) in an expression to make the expression clearer.

2.8 Decision Making: Equality and Relational Operators

- ▶ Condition
 - An expression that can be `true` or `false`.
- ▶ `if` selection statement
 - Allows a program to make a `decision` based on a condition's value.
- ▶ Equality operators (`==` and `!=`)
- ▶ Relational operators (`>`, `<`, `>=` and `<=`)
- ▶ Both equality operators have the same level of precedence, which is *lower* than that of the relational operators.
- ▶ The equality operators associate from *left to right*.
- ▶ The relational operators all have the same level of precedence and also associate from *left to right*.

Algebraic operator	Java equality or relational operator	Sample Java condition	Meaning of Java condition
<i>Equality operators</i>			
=	==	x == y	x is equal to y
≠	!=	x != y	x is not equal to y
<i>Relational operators</i>			
>	>	x > y	x is greater than y
<	<	x < y	x is less than y
≥	≥	x ≥ y	x is greater than or equal to y
≤	≤	x ≤ y	x is less than or equal to y

Fig. 2.14 | Equality and relational operators.

```
1 // Fig. 2.15: Comparison.java
2 // Compare integers using if statements, relational operators
3 // and equality operators.
4 import java.util.Scanner; // program uses class Scanner
5
6 public class Comparison
7 {
8     // main method begins execution of Java application
9     public static void main(String[] args)
10    {
11        // create Scanner to obtain input from command line
12        Scanner input = new Scanner(System.in);
13
14        int number1; // first number to compare
15        int number2; // second number to compare
16
17        System.out.print("Enter first integer: "); // prompt
18        number1 = input.nextInt(); // read first number from user
19
20        System.out.print("Enter second integer: "); // prompt
21        number2 = input.nextInt(); // read second number from user
22    }
}
```

Fig. 2.15 | Compare integers using if statements, relational operators and equality operators. (Part 1 of 3.)

```
23     if (number1 == number2)
24         System.out.printf("%d == %d%n", number1, number2);
25
26     if (number1 != number2)
27         System.out.printf("%d != %d%n", number1, number2);
28
29     if (number1 < number2)
30         System.out.printf("%d < %d%n", number1, number2);
31
32     if (number1 > number2)
33         System.out.printf("%d > %d%n", number1, number2);
34
35     if (number1 <= number2)
36         System.out.printf("%d <= %d%n", number1, number2);
37
38     if (number1 >= number2)
39         System.out.printf("%d >= %d%n", number1, number2);
40 } // end method main
41 } // end class Comparison
```

Fig. 2.15 | Compare integers using if statements, relational operators and equality operators. (Part 2 of 3.)

```
Enter first integer: 777
Enter second integer: 777
777 == 777
777 <= 777
777 >= 777
```

```
Enter first integer: 1000
Enter second integer: 2000
1000 != 2000
1000 < 2000
1000 <= 2000
```

```
Enter first integer: 2000
Enter second integer: 1000
2000 != 1000
2000 > 1000
2000 >= 1000
```

2.8 Decision Making: Equality and Relational Operators (Cont.)

- ▶ An `if` statement always begins with keyword `if`, followed by a condition in parentheses.
 - Expects one statement in its body, but may contain multiple statements if they are enclosed in a set of braces (`{ }`).
 - The indentation of the body statement is not required, but it improves the program's readability by emphasizing that statements are part of the body.
- ▶ Note that there is no semicolon (`;`) at the end of the first line of each `if` statement.
 - Such a semicolon would result in a logic error at execution time.
 - Treated as the **empty statement**—semicolon by itself.

Common Programming Error 2.9

Confusing the equality operator, ==, with the assignment operator, =, can cause a logic error or a compilation error. The equality operator should be read as “is equal to” and the assignment operator as “gets” or “gets the value of.” To avoid confusion, some people read the equality operator as “double equals” or “equals equals.”

Good Programming Practice 2.11

Place only one statement per line in a program for readability.

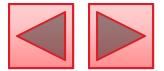

Error-Prevention Tip 2.5

A lengthy statement can be spread over several lines. If a single statement must be split across lines, choose natural breaking points, such as after a comma in a comma-separated list, or after an operator in a lengthy expression. If a statement is split across two or more lines, indent all subsequent lines until the end of the statement.

Operators	Associativity			Type
*	/	%		left to right multiplicative
+	-			left to right additive
<	\leq	>	\geq	left to right relational
\equiv	\neq			left to right equality
=				right to left assignment

Fig. 2.16 | Precedence and associativity of operators discussed.

Good Programming Practice 2.I2

When writing expressions containing many operators, refer to the operator precedence chart (Appendix A). Confirm that the operations in the expression are performed in the order you expect. If, in a complex expression, you're uncertain about the order of evaluation, use parentheses to force the order, exactly as you'd do in algebraic expressions.
